

Revolutionary new material

ROOM Outside Conservatories based in Chichester has introduced a new generation of conservatories to the UK called Four Seasons with revolutionary new glass.

The glass is filled with argon gas and has space-age technology incorporated into the double glazed units with a built in solar control system and a combination of microscopic layers on the glass. On the outside layers of metal compounds allow in natural light while keeping out oppressive summer heat and damaging UV rays. On the inside, the layers reflect interior warmth back into the room keeping you warm in winter.

"The Four Seasons is a living space solution, a sunspace if you like, not just a conservatory," said Mike Bradley managing director of Room Outside, at Quarry Lane.
